CI lead and GitHub Enterprise admin at Alarm.com, owning build and source control infrastructure for hundreds of firmware engineers across three continents.

EXPERIENCE

DevOps Engineer II @ Alarm.com

October 2025 - Present

DevOps Engineer I @ Alarm.com

June 2024 - September 2025

- CI lead for the device engineering team and GitHub Enterprise admin for Alarm.com.
- Led the device engineering team's source control migration from Bitbucket to GitHub across **100+ repositories** with submodules spanning Bitbucket, GitHub, and GitHub Enterprise mid-transition. Implemented tiered GitHub App tokens stored in Secret Server and supported hundreds of impacted engineers across multiple continents through the cutover.
- Led the migration from Bamboo to GitHub Actions across tens of CI plans, rearchitecting from Bamboo's centralized specs model to per-repo GitHub workflows backed by a shared **de-ci** repo of composite Actions and helpers. Rebuilt cache infrastructure to support ephemeral runner pods replacing static Bamboo VMs.
- Drive AI tooling adoption across Cloud Engineering and Device Engineering, building reusable AI skills on demand and training engineers on effective AI-assisted workflows.
- Maintain a shared **AI skills** library adopted across multiple teams; succeeded a predecessor RAG support agent I shelved after recognizing skills as the stronger abstraction for engineer-facing AI tooling.
- Cut average firmware build time **6× (300 → 50 minutes)** by moving Buildroot build directories from NFS to LUN-backed storage and introducing dedicated **dl-cache** and **ccache** layers for multi-GB artifacts.
- Migrated CI execution to an on-prem bare-metal Kubernetes cluster, delivering an additional 30% performance gain via ephemeral execution and cutting CI licensing **50%**.
- Built CI telemetry pipelines feeding Grafana and PowerBI dashboards on failure rates, queue times, build trends, and workload distribution; guiding engineering leadership's caching, capacity, and migration decisions.
- Refactored legacy Bamboo pipelines into version-controlled **Java Specs**, eliminating configuration drift.
- Acting as informal technical lead for a new hire outside formal reporting structure, at management's request.

Software Engineer (Part-Time) @ Three Wire Systems

July 2023 - June 2024

- Developed and maintained full-stack applications (Ruby on Rails, PostgreSQL) supporting a federal government organization (FLRA).
- Automated environment deployments using AWS Elastic Beanstalk and implemented CI pipelines via GitHub Actions for testing and security scanning.
- Built AWS-based automation workflows (IAM, SES, SNS, Lambda, DynamoDB) to generate recurring analytics and system health reports.

EDUCATION & TECHNICAL SKILLS

University of Maryland, College Park

January 2022 - May 2024

B.S. Computer Science

GPA: 3.7

Languages: Python, Ruby, C/C++, Java, Bash, PowerShell, SQL

Infrastructure & DevOps: Linux, Kubernetes, Docker, Terraform, AWS, vSphere, Bamboo, GitHub Actions, Puppet, Ansible, Tanium

Observability & Tooling: Grafana, PowerBI, Jira, Confluence
